## 1. Introduction

### 1.1. Purpose

The purpose of this document is to define the functional requirements of the **Mini App – User Registration & Authentication** system. This document is intended for students, instructors, and developers who need to understand how the system works before implementation.

### 1.2. Scope

The system allows users to create an account, log in, view their profile or dashboard, and log out securely. It also ensures that protected pages cannot be accessed unless the user is authenticated. This project focuses only on basic authentication features and does not include advanced modules such as payment or admin management.

### 1.3. Definitions, Acronyms, and Abbreviations

List and define important terms used in this document.

## 2. Overall Description

### 2.1. System Perspective

The system is a web-based application composed of a **React frontend**, a **Spring Boot backend API**, and a **database**. The frontend communicates with the backend to process authentication requests with a fully integrated process, while the backend handles validation, security, and data storage.

### 2.2. User Classes and Characteristics

Identify the different types of users and their characteristics.

### 2.3. Operating Environment

- Client: Web browser (Chrome, Edge, Microsoft)
- Frontend: React
- Backend: Spring Boot
- Database: MySQL / PostgreSQL
- Tools: draw.io / diagrams.net

### 2.4. Assumptions and Dependencies

- Users have internet access
- The backend server is available
- Password encryption and token-based authentication are implemented
- The database is properly configured

## 3. System Features and Functional Requirements

Describe each major feature of the system and its functional requirements.

### 3.1. Feature 1:

Description: This feature allows a guest user to create a new account by providing valid personal information.

Functional Requirements:

- The system shall allow users to register using a valid email and password
- The system shall validate user input before saving data
- The system shall prevent duplicate email registrations
- The system shall encrypt the password before storing it in the database

### 3.2. Feature 2:

Description: This feature allows registered users to log in, access protected pages, and log out securely.

Functional Requirements:

- The system shall allow users to log in using email and password
- The system shall authenticate user credentials
- The system shall allow access to the dashboard only when logged in
- The system shall invalidate the session or token upon logout

## 4. Non-Functional Requirements

**Security:** Passwords must be encrypted and protected pages must require authentication

**Performance:** The system should respond to login and registration requests within a few seconds

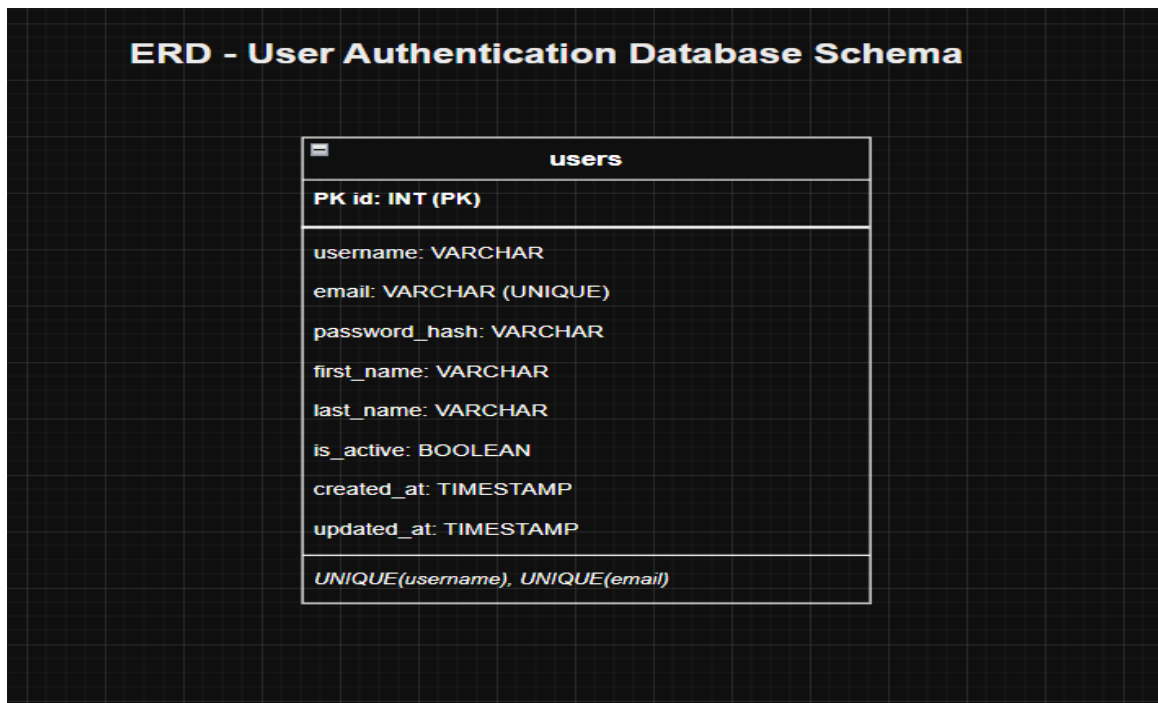

**Usability:** The system should be easy to use and user-friendly

**Reliability:** The system should handle invalid login attempts properly

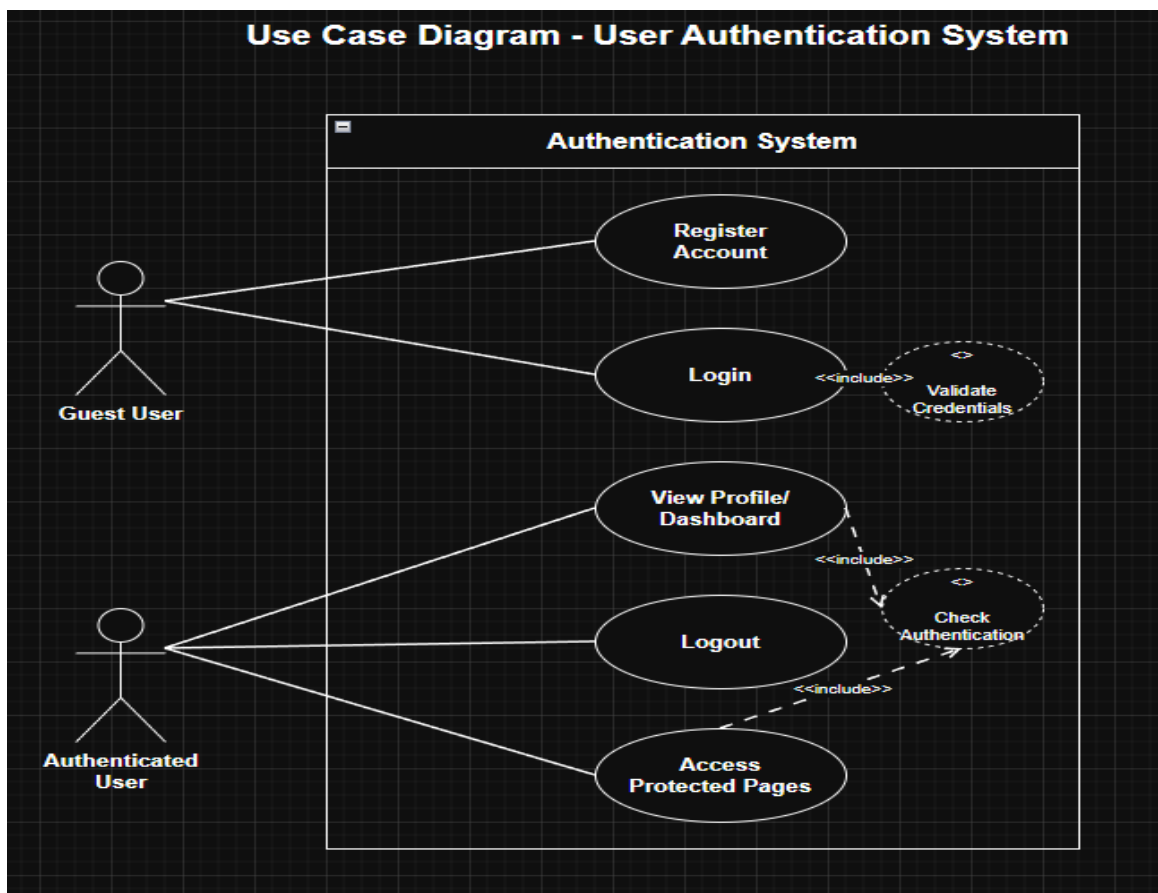

## 5. System Models (Diagrams)

*Insert the necessary diagrams for the system:*

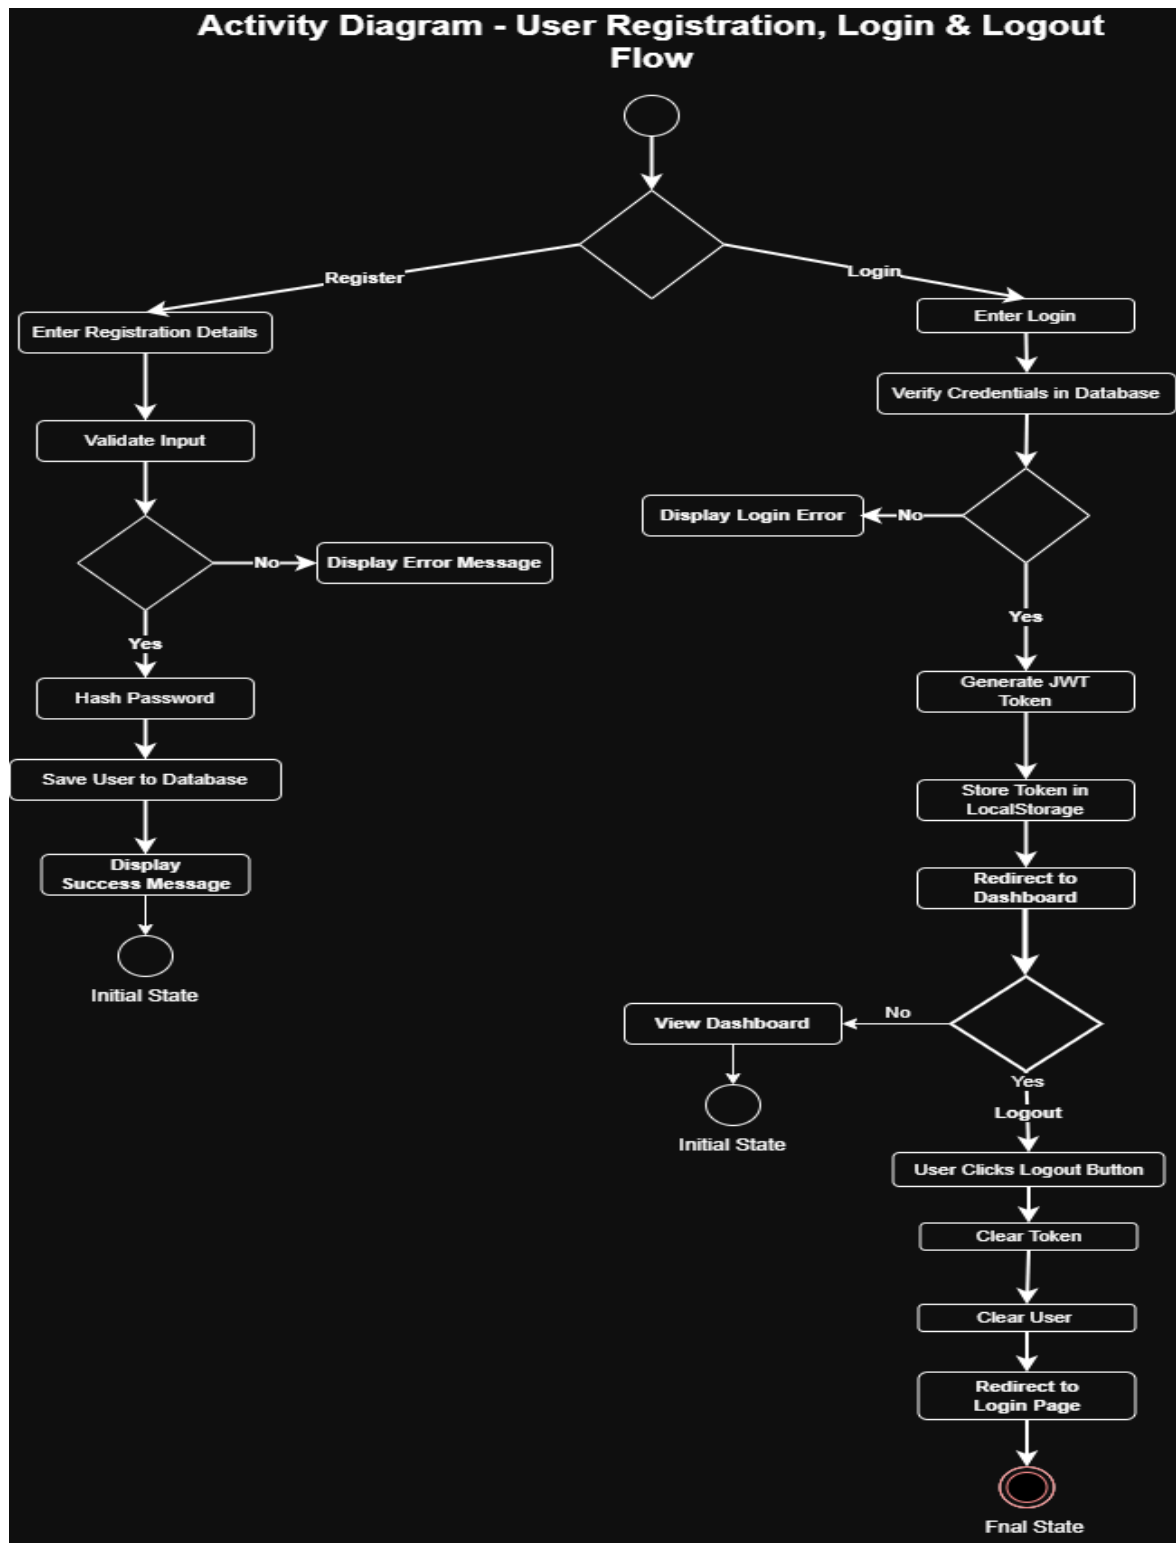

## 5.1. ERD

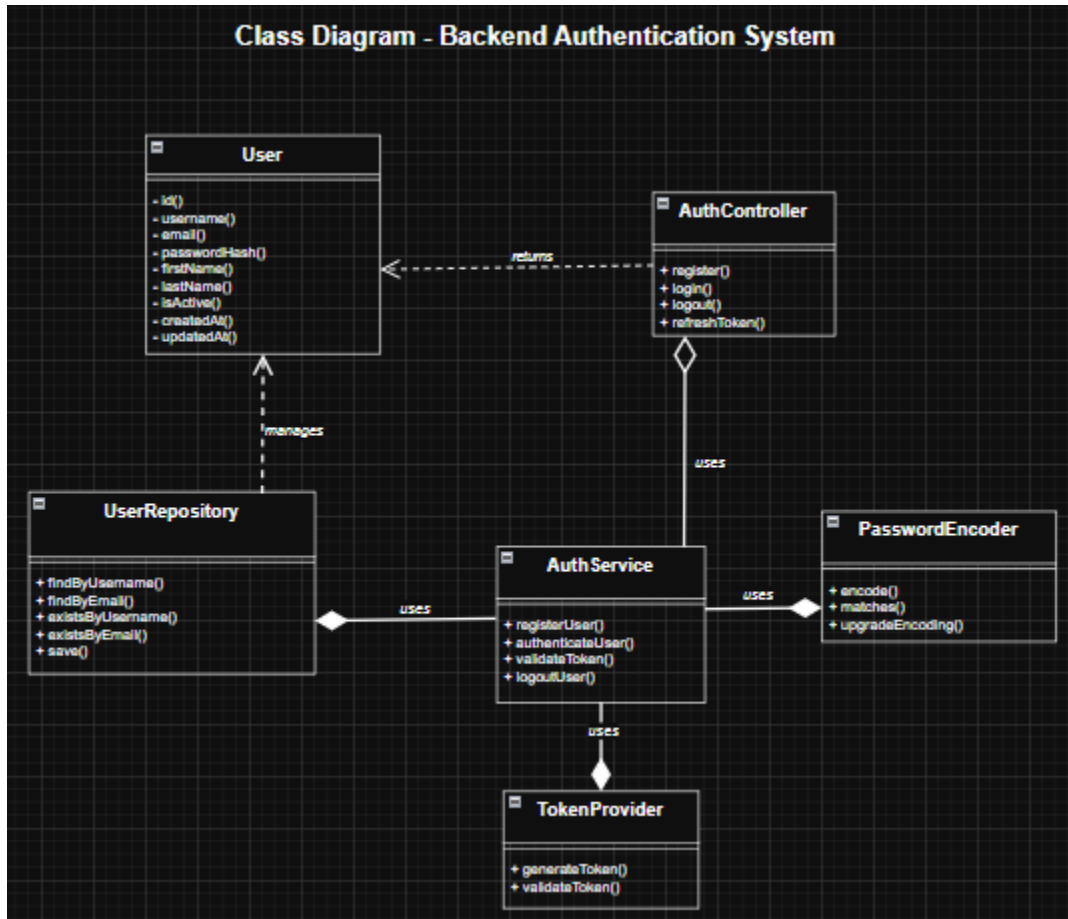

## 5.2. Use Case Diagram

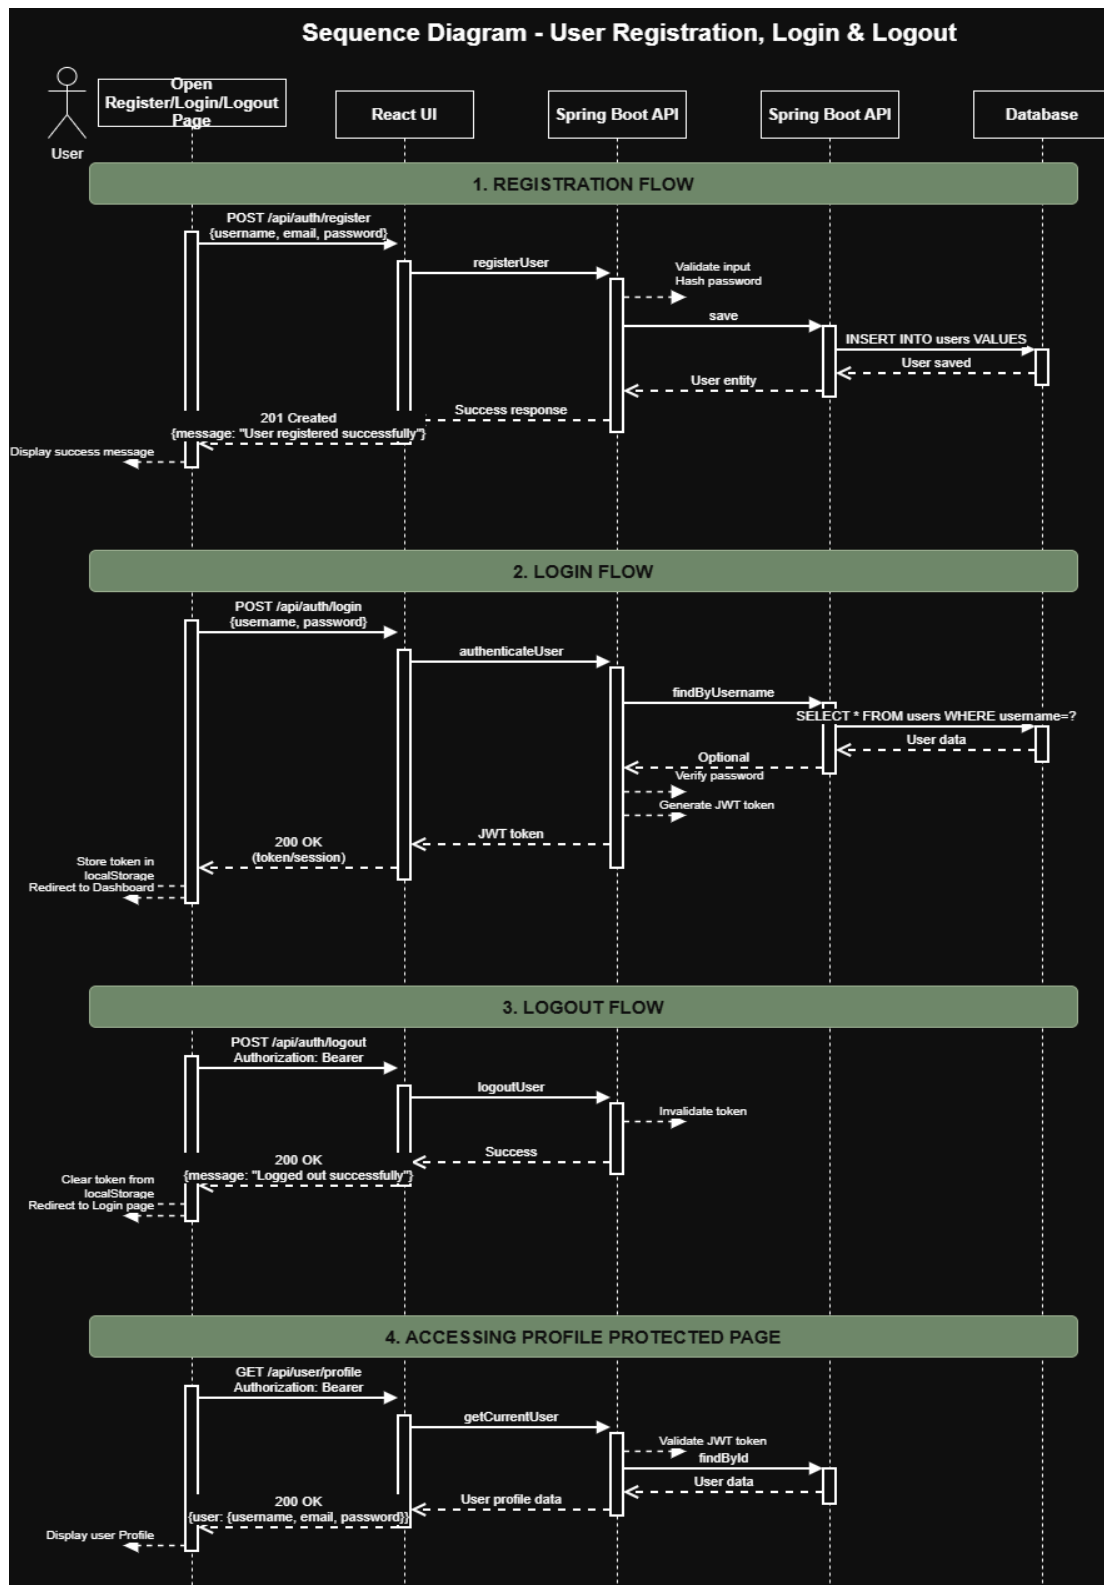

### 5.3. Activity Diagram

#### 5.4. Class Diagram

## 5.5. Sequence Diagram

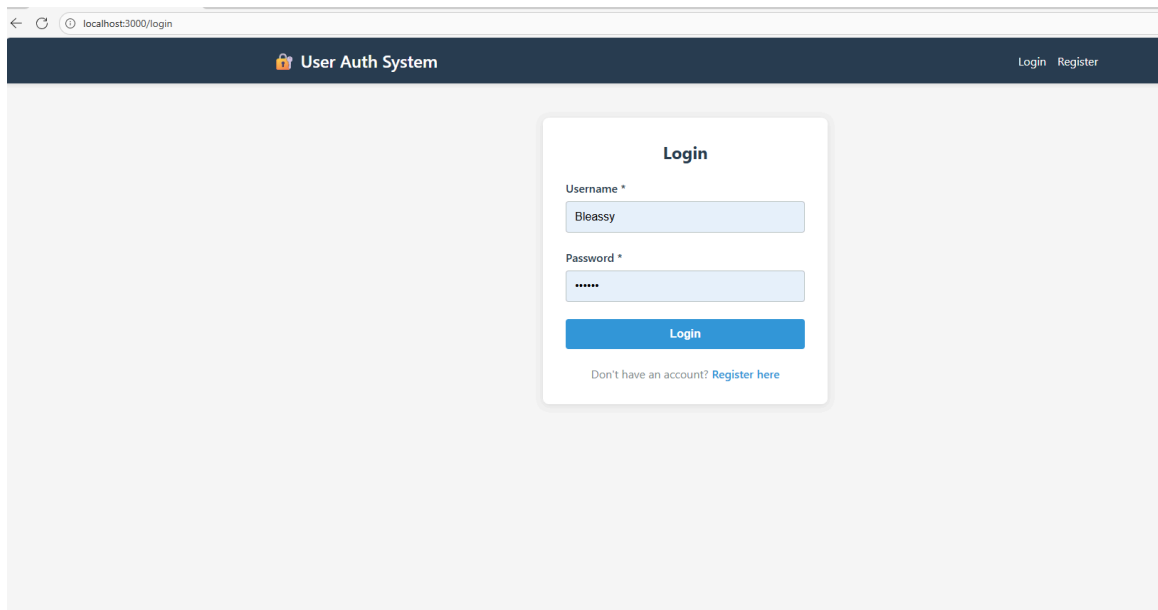

## 6. Appendices

Include any additional information, references, or support materials.

## 7. Screenshot of the Web UI

### 7.1 Login

The screenshot shows a web browser window with the address bar displaying 'localhost:3000/login'. The page title is 'User Auth System'. The main content area features a login form with the following elements:

- Username \***: A text input field containing the value 'Bleassy'.
- Password \***: A password input field with masked characters '\*\*\*\*\*'.
- Login**: A blue button to submit the login form.
- Don't have an account? Register here**: A link for new users to register.

### 7.2 Registration

localhost:3000/register
